

Live Streaming video is the perfect tool to bring your event live to a wide audience on all devices.

Streamy (@Kobayashimaru) can offer you a complete streaming solution for both small and large projects.

We can film, mix and deliver the signal to your viewers, no matter where they are in the world and what mobile or fixed device they are using.

We use broadcast quality H264 or HEVC encoders to bring the video signal from your event to our server room.

From there we use our own cloud-based transcoding and delivery services to bring the stream directly to popular social media like YouTube, Facebook and Twitter.

We can also offer you an independent content delivery network (CDN) with a “white label” video player for smooth integration with your existing website without any unwanted branding or ads.

This CDN platform is serviced by Akamai which guarantees you a worldwide coverage with multiple bitrates on all different platforms (IOS, Android, Windows, linux, ...) and devices.

When there is no dedicated internet connection available on your event, we can provide you with our own connectivity like Bonded 4G or IP via KA-Sat.

Please contact us for more information so we can tailor a solution to your needs.
